I received few tutorial requests from my readers that asked to me, how to design Facebook style friend request system using MySQL. I had posted few tutorials about twitter style friend follow and follower concept designs, Facebook friend system is involved with few pending steps such as sending a request and accepting a request. Here I have discussed how to design a database and implementation of SQL queries, hope this post will help you to understand the friend system.

Previous Tutorials: [Facebook Style Messaging System Database Design.](#)

Database Design

To build the friend request system, you have to create three tables such as Users, Updates and Friends.

Users Table

User table contains all the users registration details.

```
CREATE TABLE `users` (
  `user_id` INT(11) NOT NULL AUTO_INCREMENT ,
  `username` VARCHAR(45) ,
  `password` VARCHAR(100) ,
  `email` VARCHAR(45) ,
  `friend_count` INT(11) ,
  `profile_pic` VARCHAR(150),
  PRIMARY KEY (`user_id`));
```

user_id	username	password	email	friend_count	profile_pic
1	srinivas	e10adc3949ba59abbe56e057f20f883e	srinivas@9lessons.info	2	NULL
2	rajesh	92251e8665e19be62c86ff039528e16e	rajesh@9lessons.info	1	NULL
3	arun	ad846fd1138e66a1cadd0fb4b8644671	arun@9lessons.info	1	NULL

Data will store in following way, here the password data [encrypted with MD5 format](#).

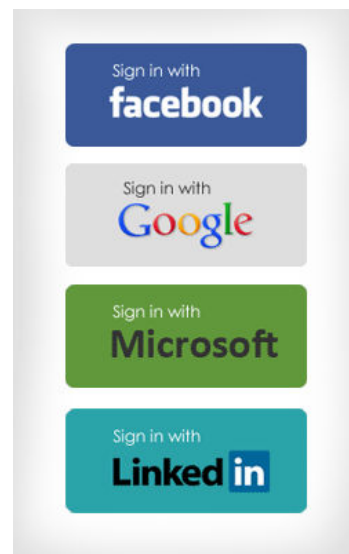

Updates Table

This table contains user status updates data. Here user_id_fk is the FOREIGN KEY to REFERENCES users.user_id

```
CREATE TABLE `updates` (
  `update_id` INT(11) AUTO_INCREMENT ,
  `update` VARCHAR(45),
  `user_id_fk` VARCHAR(45),
  `created` INT(11) ,
  `ip` VARCHAR(45),
  PRIMARY KEY (`update_id`),
  FOREIGN KEY (user_id_fk) REFERENCES users(user_id));
```

Wall Script 7 The Social Network Clone Script.

update_id	update	user_id_fk	created	ip
1	My first update.	1	2147483647	123.223.23.43
2	9lessons Programmin Blog	2	1385348557	182.243.232.121
3	My second update	1	2147483647	123.232.111.121
4	TheWallScript.com	3	2147483647	231.221.191.43

Friends Table

This table contains user friends relation data. Here friend_one and friend_two are the FOREIGN KEYS to REFERENCES users.user_id

```
CREATE TABLE `friends` (
  `friend_one` INT(11) ,
  `friend_two` INT(11) ,
  `status` ENUM('0','1','2') DEFAULT '0',
  PRIMARY KEY (`friend_one`,`friend_two`),
  FOREIGN KEY (friend_one) REFERENCES users(user_id),
  FOREIGN KEY (friend_two) REFERENCES users(user_id);
```

Here status 0, 1 and 2 values references to Pending Friend Request, Confirm Friend Request and You.

friend_one	friend_two	status	created
1		1 2	2147483647
2		2 2	2147483654
1		2 1	2147483726
3		3 2	2147484111
1		3 1	2147484642
3		2 0	2147485546

User Registration

This statement is required for user registration, here status 2 represents to you. This helps while retrieving friend updates along with your updates.

```
INSERT INTO friends
(friend_one,friend_two,status)
VALUES
('$user_id','$user_id','2');
```

Add Friend

Use the following insert statement for adding a friend.

```
INSERT INTO friends
(friend_one,friend_two)
VALUES
('$user_id','$friend_id');
```

Confirm Friend Request

Here confirming the friend request, updating the status 0 to 1

```
UPDATE friends
SET status="1"
WHERE
(friend_one="$user_id" OR friend_two="$user_id")
AND
(friend_one="$friend_id" OR friend_two="$friend_id");
```

Checking Friend

Here friend_one represents the friend request owner.

```
SELECT 'friend_one','friend_two','status' FROM friends
WHERE
```

Tweet to @9lessons

```
(friend_one="$user_id" OR friend_two="$user_id")
AND
(friend_one="$friend_id" OR friend_two="$friend_id")
```

PHP Code

This contains simple PHP code, this helps you to display the proper friend request related buttons.

```
<?php
include 'db.php';
$user_id=user session value;
$friend_id=friended value;
$result=mysqli_query($connection,"SELECT 'friend_one','friend_two','status' FROM
friends WHERE (friend_one=\"$user_id\" OR friend_two=\"$user_id\") AND
(friend_one=\"$friend_id\" OR friend_two=\"$friend_id\")");
$row=mysqli_fetch_array($result,MYSQLI_ASSOC);

if($row['friend_one']==$user_id && $row['status']=='0')
{
```

```
}
else
{
```

```
}
?>
```

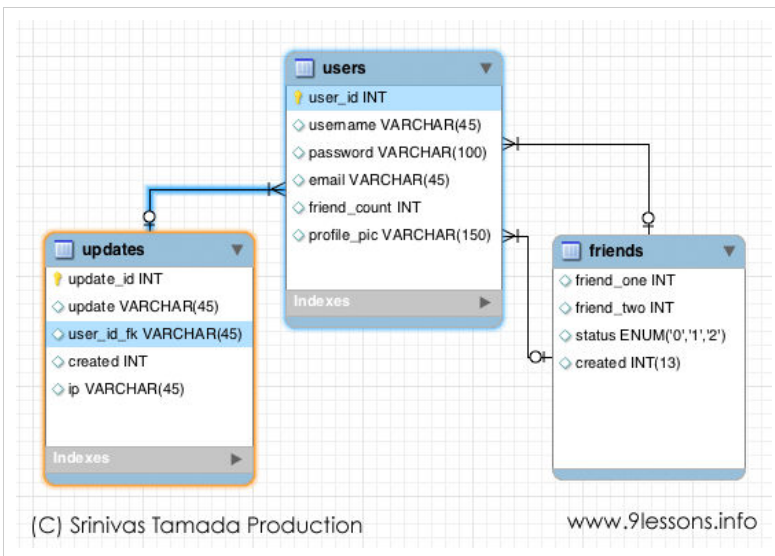

Friends Updates List

Data relations between users, friends and updates tables for friend feed results. The following SQL statement uses table objects: U for users, D for updates, and F for friends. Here \$user_id references the user session value and \$friend_id references the friend user row id value.

```
SELECT U.username, U.email, D.update_id, D.update, D.created
FROM users U, updates D, friends F
WHERE
D.user_id_fk = U.user_id
AND

CASE
WHEN F.friend_one = '$user_id'
THEN F.friend_two = D.user_id_fk
WHEN F.friend_two = '$user_id'
THEN F.friend_one = D.user_id_fk
END

AND
F.status > '0'
ORDER BY D.update_id DESC;
```

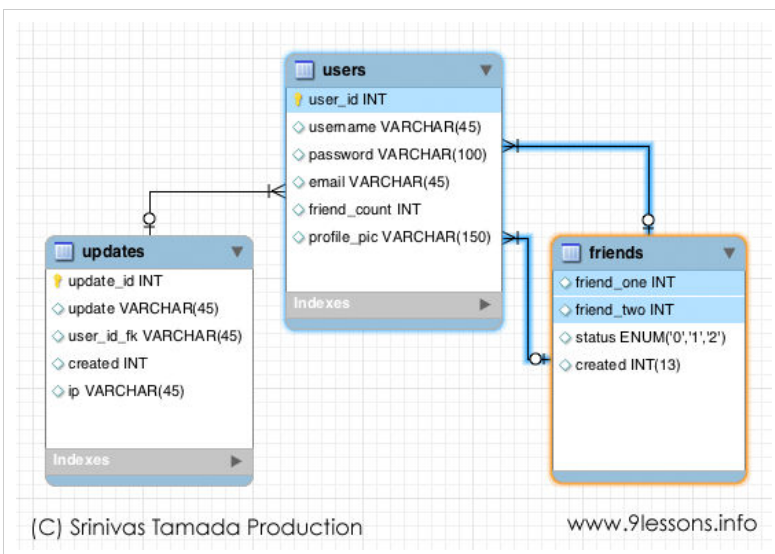

Friends List

Data relations between users and friends tables for displaying user friends. Take a look at the following SQL statement users table object as U and friends table object as F . Here user_id is the login user session value.

```
SELECT F.status, U.username, U.email
FROM users U, friends F
WHERE
CASE

WHEN F.friend_one = '$user_id'
THEN F.friend_two = U.user_id
WHEN F.friend_two= '$user_id'
THEN F.friend_one= U.user_id
END

AND
F.status='1';
```

db.php

Database configuration file, modify username, password and database values.

```
<?php
define('DB_SERVER', 'localhost');
define('DB_USERNAME', 'username');
define('DB_PASSWORD', 'password');
```

```
define('DB_DATABASE', 'database');  
$connection = mysqli_connect(DB_SERVER,DB_USERNAME,DB_PASSWORD,DB_DATABASE);  
?>
```

Thanks for the tut!

When "checking a friend", what if the current user has already confirmed the friend's request (i.e. the status has been set to 1), as it's written, wouldn't your logic errantly display the "confirm request" box?

Regarding the sql for confirming a friend request, how could the user ever be in a position to confirm a friend request as friend_one? Your SQL suggest he could.

Was that your intension to include your OWN updates in the "Friends Updates list", because isn't that what "F.status > '0'" would allow for?

I'm thinking the app shouldn't allow for the same pair of friends to have multiple rows in the friends table, right? So, the following shouldn't be possible, But I didn't see where your script was checking for that when adding a new record.

```
friend_one = 123; friend_two = 456  
friend_one = 456; friend_two = 123
```
